CMM 500

REDIFINING PRECISION

The CMM 500 Compressor Master Meter is a new type of reference flow meter that has been especially developed for highprecision measurement of the delivery volume of compressors and for the billing of compressed air.

The CMM 500 can be used both directly behind the compressor for measuring wet compressed air and as a compressed air meter for measuring consumption and billing of dry compressed air.

It is based on a Venturi tube that meets with all the requirements of ISO 5167-3 for dimensional accuracy and surface quality. ISO 5167 is an internationally recognized standard that provides guidelines for accurate flow measurement with differential meters. Venturi pipes are extremely reliable, easy to handle and require low maintenance.

The main advantage of a Venturi tube towards many other measuring systems is the higher differential pressure with a lower pressure loss and the shorter inlet and outlet sections. At the same time, the low-pressure loss is a major advantage compared to many other measuring methods.

The large measuring range measuring span 1:130 and an accuracy < 0.5 % of the measured value (from 0.2 Qmax to Qmax) are unique.

The small, compact design and the use of long-term stable and highly accurate pressure sensors with stainless steel diaphragms are the basis for precise consumption and flow measurement of operating volume, standard volume, pressure, differential pressure and temperature in one measuring device.

With the help of the valve block, service or maintenance can be carried out on site at any time (zero-point correction, condensate drain, sensor replacement for calibration), even during operation under pressure.

MEASUREMENT PRINCIPLE

Flow measurement with the Venturi tube manufactured according to ISO 5167-3

Fordifferential pressure measurement, two separate lines lead to a differential pressure measuring cell. One pressure connection (pressure 1) is located at the inlet of the Venturi tube and a second pressure connection is located at the outlet of the Venturi tube (pressure 2). Without flow, the pressure at the inlet and outlet is identical.

As soon as flow is present, the flow rate in the narrowing increases. At the same time, the static pressure 2 decreases. The pressure at the inlet is higher than at the outlet.

The pressure difference is a rate of the velocity and therefore also of the volume flow. The greater the flow velocity and the associated decrease in pressure in the Venturi tube, the greater the pressure difference. Two additional precision sensors (temperature and absolute pressure) are used to calculate the mass or standard volume flow in accordance with DIN 1343 or ISO 1217 compressed air standard.

The design of the Venturi tube ensures a large measuring span (1:130) with low pressure loss at the same time.

FIELDS OF APPLICATION

Reference measuring device for blower and compressor test benches (effective delivery capacity)

Continuous monitoring of the delivery volume of individual compressors

High-precision measurement of the volume of compressed air supplied to third parties for billing purposes with DIN EN ISO/IEC 17025 certificate

Measurement on the "wet side" directly downstream the compressor

The CMM 500 Compressor Master Meter is a reference flow meter that has been especially developed for measuring the delivery volume of wet compressed air directly downstream of compressors.

The large measuring span 1:130 and an accuracy of <0.5 % of the measured value (0.2 Qmax to Qmax) are unique.

Service or maintenance can be carried out at any time via the mounting plate (zero-point correction, condensate drain, sensor replacement for calibration), even during operation under pressure.

MECHANICAL ADVANTAGES

- Accuracy < 0,5%, approved by DIN EN ISO/IEC 17025 certificate
- Huge turn down ratio 1:130
- Fast reaction time, detection of peaks, no adaption time necessary like in case of ultra sound gas counters
- No long straight inlet section required
- Extremely low pressure drop, < 70 mbar at max flow
- Applicable for all gas types (just set up the gas density)
- Pressure range up to 10 bar(g), 30 bar(g), 100 bar(g)
- Direct output of standardized volume flow Nm³, Nm³/h (DIN 1343 resp. ISO 1217)
- Addtional outputs: temperature in °C or °F, pressure and differential pressure in bar, psi...
- Available output signals: Modbus-RTU, Modbus TCP, POE, MBus, HART, 4 ... 20 mA
- ATEX Version for flammable and combustible gases coming soon

MECHANICAL ADVANTAGES

Robust and long-term stable:

- •The Venturi tube manufactured in accordance with ISO 5167-3 is the basis for highly precise measurement results, an internationally recognized standard
- No moving parts as with turbines or gas meters, no ageing of bearings or damage like in case of turbines due to particles or abrasion
- Long-term stable measurement thanks to robust and highly accurate pressure and temperature sensors
- Insensitive to pressure surges and exceeding of the measuring range limit thanks to the use of longerm stable precision pressure sensors with high overload resistance and stainless-steel diaphragms
- •Typical gas meters, turbines, rotary pistons etc. can only be used in dry air or gas
- Simple service and maintenance (zero point correction, condensate drain, sensor replacement for calibration) also possible during operation under pressure.

EASY SERVICING AND PRACTICALITY

During development, attention was paid to practicality and, above all, easy servicing. Thanks to the multifunctional valve block, all necessary maintenance and service work can be carried out safely and without removing the venturi tube under pressure.

Condensate drain

When installed directly behind the compressor, the water separators do not always operate 100%. Condensate can be drained via the drain valve during operation

Zero-point adjustment of the differential pressure sensor

A zero point adjustment of the differential pressure sensor can be carried out at any time via the display during operation under pressure and flow.

The sensor can be disconnected from the line pressure during operation via the valve block and can be sent for calibration and service.

USE OF THE CMM 500 TO SAVE COSTS

Continuous measurement of the delivery quantity helps to save costs

Sample calculation

Compressor 250 kW(el) * 6000 Bh * 0,17 €/kWh Annual electricity costs: 255.000 €

Clogged, dirty intake filters or wear can sometimes cause up to 10% loss of performance. This corresponds to **25.500 € p.a.**

With the **CMM 500 Compressor Master Meter**, you can continuously monitor the delivery volume. Problems are detected at an early stage and appropriate countermeasures can be taken

ANALYSIS OF THE SPECIFIC PERFORMANCE

The specific output of the compressor can be calculated by measuring the power consumption and simultaneously measuring the delivery volume. The specific output is calculated using the ratio of the energy consumption required in kWh to the volume of air delivered in m³ over the same period of time

Specific performance $=\frac{kWh}{m^3}$

The specific performance index of the compressor provides information about the nature of the compressor. The color bar below can be used as an evaluation aid

A typical specific power requirement of an oil-injected compressor can be as follows:

Delivery rate: 43,7 Nm3/min (according to ISO 1217 based on 20°C, 1000 mbar) Total power consumption: 272,7 kW Specific power requirement = 272,7 kW / 43,7 m³/min = 6,24 kW / m³/min = 0,104 kWh / m³

5 | CSINSTRUMENTS

EFFICIENCY MEASUREMENT OF COMPRESSORS FOR ENERGY SAVING -AIR AUDITS-

The delivery volume of compressors depends on the intake air.

The installation location and climatic conditions must already be taken into account when designing compressed air stations.

Large temperature fluctuations, e.g. between day and night, lead to uneven delivery quantities.

The CMM 500 is the heart of a complete measuring system for compressors consisting of:

DS 500 mobile

Intelligent mobile paperless recorder with 12 sensor inputs for data analysis and evaluation with 6 GB memory

- CMM 500 Compressor Master Meter for high-precision measurement of the delivery volume in relation to standard ISO 1217 or DIN 1343 in Nm³/h, Nm³, Nm³/min or I/s
- IAC 500 Indoor Air Quality Sensor for measuring the intake air of the compressor, humidity, absolute pressure and temperature
- CS PM 600 Mobile Current / Effective Power Meter for measuring the total power requirement of the compressor

With the complete measuring system for efficiency measurement (specific output kWh/m³), the efficiency of the compressor can be calculated for ISO 1217 (20 °C and 1000 mbar) or for intake conditions.

This volume flow therefore does not refer to compressed air, but to expanded air according to ISO 1217 at 20 °C and 1000 mbar or to the respective ambient conditions in the compressor room.

Option Signal outputs / bus connection D1 2 x 420 mA analog output (galvanically isolated), pulse output, RS 485 (Modbus-RTU) D4 1 x 420 mA analog output (not galvanically isolated), pulse output, RS 485 (Modbus-RTU) D4 1 x 420 mA analog output (not galvanically isolated), pulse output, RS 485 (Modbus-RTU) D5 Ethernet interface (Modbus/TCP), 1 x 420 mA analog output (not galvanically isolated), pulse output, RS 485 (Modbus-RTU) D8 M-Bus, 1 x 420 mA analog output (not galvanically isolated), pulse output, RS 485 (Modbus-RTU) D9 Ethernet interface PoE (Power over Ethernet), (Modbus/T0 1 x 420 mA analogue output, (not electrically isolated), poutput RS 485 (Modbus-RTU)						
D1 2 x 420 mA analog output (galvanically isolated), pulse output, RS 485 (Modbus-RTU) D4 1 x 420 mA analog output (not galvanically isolated), pulse output, RS 485 (Modbus-RTU) D5 Ethernet interface (Modbus/TCP), 1 x 420 mA analog output (not galvanically isolated), pulse output, RS 485 (Modbus-RTU) D8 M-Bus, 1 x 420 mA analog output (not galvanically isolated), pulse output, RS 485 (Modbus-RTU) D8 Ethernet interface PoE (Power over Ethernet), (Modbus/TC) 1 x 420 mA analogue output, (not electrically isolated), pulse output, RS 485 (Modbus-RTU) D9 1 x 420 mA analogue output, (not electrically isolated), poutput RS 485 (Modbus-RTU)						
D1 pulse output, RS 485 (Modbus-RTU) D4 1 x 420 mA analog output (not galvanically isolated), pulse output, RS 485 (Modbus-RTU) D5 Ethernet interface (Modbus/TCP), 1 x 420 mA analog output (not galvanically isolated), pulse output, RS 485 (Modbus-RTU) D8 M-Bus, 1 x 420 mA analog output (not galvanically isolated), pulse output, RS 485 (Modbus-RTU) D9 Ethernet interface PoE (Power over Ethernet), (Modbus/TCP) (Nodbus-RTU)						
D4 pulse output, RS 485 (Modbus-RTU) D5 Ethernet interface (Modbus/TCP), 1 x 420 mA analog output (not galvanically isolated), pulse output, RS 485 (Modbus-RTU) D8 M-Bus, 1 x 420 mA analog output (not galvanically isolated), pulse output, RS 485 (Modbus-RTU) D9 Ethernet interface PoE (Power over Ethernet), (Modbus/TCP), 1 x 420 mA analogue output, (not electrically isolated), poutput RS 485 (Modbus-RTU)	2 x 420 mA analog output (galvanically isolated), pulse output, RS 485 (Modbus-RTU)					
D5 output (not galvanically isolated), pulse output, RS 485 (Modbus-RTU) D8 M-Bus, 1 x 420 mA analog output (not galvanically iso ted), pulse output, RS 485 (Modbus-RTU) D9 Ethernet interface PoE (Power over Ethernet), (Modbus/T0 1 x 420 mA analogue output, (not electrically isolated), poutput RS 485 (Modbus-RTU)	1 x 420 mA analog output (not galvanically isolated), pulse output, RS 485 (Modbus-RTU)					
D9 ted), pulse output, RS 485 (Modbus-RTU) D9 Ethernet interface PoE (Power over Ethernet), (Modbus/T0 1 x 420 mA analogue output, (not electrically isolated), p output RS 485 (Modbus-RTU)						
D9 1 x 420 mA analogue output, (not electrically isolated), p output RS 485 (Modbus-RTU)

DESCRIPTION	ORDER NO.
Accessories:	
ISO calibration certificate (5 calibration points)	3200 0001
DAkkS-certificate (5 calibration points)	on request
Intelligent chart recorder DS 500 mobile, 4 sensor inputs	0500 5012
CS PM 600 mobile current/effective power meter 100 A	0554 5341
CS PM 600 mobile current/effective power meter 600 A	0554 5342
IAC 500 sensor for measuring ambient con- ditions (absolute pressure, temperature, rel. humidity), incl. wall bracket	0604 1000

TECHNICAL DATA CMM 500 Compressor Master Meter				
Measuring medium:	Air, gases			
Accuracy: (v. M. = from mea- sured value):	± 1% for Qmin up to 0,2 Qmax ± 0,5% for 0,2 Qmax up to Qmax			
Typically achievable Accuracy when installing CS inlet and outlet sections:	± 0,75% for Qmin up to 0,2 Qmax ± 0,3% for 0,2 Qmax up to Qmax			
Measuring principle:	Differential pressure, Venturi			
Measuring range:	1:130			
Response time:	t 99: < 1 sec.			
Medium temperature:	-20° +100 °C			
Operating pressure:	Max. 16 bar (g), on request 30 bar / 100 bar			
Ambient temperature:	-30° +70 °C			
Power supply:	18 36 VDC			
Signal output:	Standard: RS 485 (Modbus-RTU), 420 mA, pulse Optional : Ethernet Interface, M-Bus			
Process connection:	Flange according to DIN EN 1092-1 or ANSI Flange			
Installation conditions:	In horizontal lines or in risers			

Inlet-/outlet section

- Inlet and outlet sections ensure calm flow conditions and highly accurate measurements
- When installing the CS inlet or outlet sections, it is ensured that there is no turbulence due to different inner diameters, edges of CMM 500 and inlet or outlet section.
- In the case of extreme disturbances and turbulences, e.g. caused by check valves, valves, partially closed ball valves, it is recommended to install a perforated plate straightener in front of the inlet section
